

IRAN OPS ENDGAME ENGINE

One-page repo summary with replay chart

What It Is

Offline-first analyst web app for estimating whether the contract family 'Trump announces end of military operations against Iran by [date]' resolves YES across date buckets. Repo docs describe it as transparent, explainable, auditable, and deterministic in local replay.

Who It's For

Primary persona: an analyst reviewing geopolitical signals, market pricing, wording risk, and scenario outcomes.

What It Does

- Dashboard by date bucket with model-vs-market gaps, trade/watch calls, thesis cards, catalysts, and sizing guidance.
- Signal Explorer for raw source events, normalized signals, confidence, status, and projected impact.
- Timeline with executive brief, narrative tracker, source coverage, chronology, and live-news clustering.
- Scenario simulation, deterministic replay/backtest, and wording-risk interpretation.
- Fixture-first local development with Prisma schema prepared for future persistence.

How It Works

- Next.js App Router UI over typed payloads from ``apps/web/src/lib/api/service.ts``.
- ``getRepository()`` swaps fixture-backed ``DemoRepository`` and guarded ``PrismaRepository`` paths.
- Flow: adapters/source events -> classification + signal enrichment -> belief engine + decision modules -> API payloads -> analyst UI.
- Timeline and ``/api/timeline/brief`` reuse the same clustering/summary pipeline.

How To Run

- Install Node 20+ and npm.
- Copy ``.env.example`` to ``.env`` or ``.env.local``; repo defaults include ``FIXTURE_MODE=true``.
- Run ``.run.sh``, or use ``npm install``, ``npm run db:generate``, then ``npm run dev``.

Prediction Replay Since Launch

Using repo replay history from 2026-04-08 forward. Average market-model gap starts at 11% and ends at 63%. Early buckets tighten materially; later live points diverge sharply.
